Stellar Cyber 6.6.0s is now live! Discover all the updates in the release notes!

AWS Connectors Authentication with IAM Role

The Stellar Cyber AWS connectors support the *IAM Role* authentication method, which is also referred to as *assume role* or *IAM role assume*.

This authentication method temporarily takes on a set of credentials used to access AWS resources. The temporary credentials can be used to make API calls to any AWS service. The role is created with two policies: a role trust policy that specifies who can assume the role and a permissions policy that specifies what the role can do.

For example, when configuring the AWS CloudWatch connector, you select **IAM Role** and then configure the fields associated with the role.

The following Stellar Cyber connectors support the IAM Role Auth Method:

- Generic S3
- AWS CloudWatch
- AWS GuardDuty
- AWS CloudTrail
- AWS Inspector
- Amazon Security Lake (this connector only supports assume role authentication where Stellar Cyber maintains the account that assumes the provided role)
