Stellar Cyber 6.6.0s is now live! Discover all the updates in the release notes!

Configuring AWS Port Mirroring

You can configure AWS mirroring to monitor traffic from a single mirrored port. You must configure the mirror port on AWS before you configure Stellar Cyber.

To configure AWS port mirroring:

1. Configure traffic mirroring on AWS. Take note of:
    - The VXLAN UDP port number (4789 is the default AWS port)
    - The VNI, which is the VXLAN ID
    - Limitations on the instance types supported for traffic mirroring.

    When you configure AWS:
    - Keep the mirror source and target in the same VPC.
    - Per the AWS traffic mirroring instructions, you must create a traffic mirror filter with one or more traffic mirror rules to define the traffic to be mirrored. You cannot leave the traffic mirror filter empty.
    - When you create the **Traffic Mirror Filter**, do not choose any network services.
    - The **Traffic Mirror Target** must be **Network Interface**.
    - The **Traffic Mirror Session** target must be the data sensor interface.
    - The **Traffic Mirror Session** number must be **1**.
    - Leave the **Traffic Mirror Session Packet Length** at the default value.
    - Do not mirror to an interface running DPDK.
    - Ensure that your configuration does not create a loop within AWS.
    - Do not mirror from a source host that sends traffic directly to a destination interface, as the data sensor might get duplicate traffic.
2. Log in to Stellar Cyber.
3. Go to **System | DATA SOURCE MANAGEMENT | Sensors | Sensors**. The **Sensor List** is displayed.

4. Click for the data sensor you want to send the traffic to. The **Edit Data Sensor Parameters** window is displayed.
5. Enable **AWS Mirror**. The additional fields are displayed.
6. Enter the **Physical Ethernet Port** index number. You can find this by using the `show vtep` command on the sensor.
7. Enter the VXLAN UDP port number from AWS.
8. Enter the **VNI**, which is the VXLAN ID you configured in AWS.
9. Click **Submit**. The parameters are immediately updated.
