Stellar Cyber 6.6.0s is now live! Discover all the updates in the release notes!

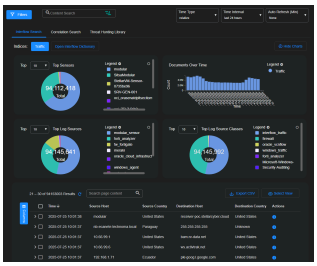

Configuring Generic Log Capture

You can capture generic logs from your devices, which you can send to Stellar Cyber Customer Success. Stellar Cyber can use these logs to generate a custom log parser for your device. Note that Stellar Cyber cannot use these generic logs for generating alerts.

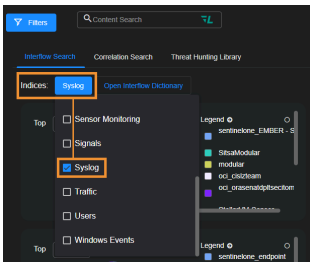

To send the logs to Stellar Cyber:

1. Configure your device to send logs to UDP port 5201.
2. Allow Stellar Cyber to collect a significant number (100 or more) of logs.
3. In Stellar Cyber, select **Threat Hunting**.

   The **Threat Hunting** page appears with the **Interflow Search** tab open by default.

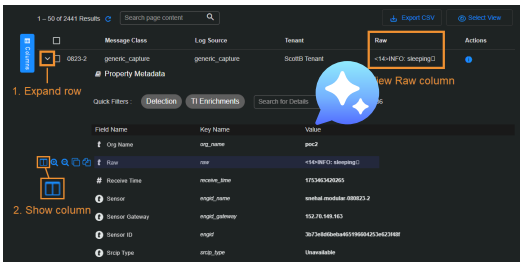

4. Set **Indices** as **Syslog**.

5. Search for `dev_type:generic_capture`.

   Stellar Cyber displays the captured logs.

6. Select › to expand a record.
7. Scroll to **raw** and hover your cursor over its row.
8. Select **Show column** in the set of options that appears to add **raw** to the columns.

This causes the **Raw** column to appear not just for this row but the entire table.

9. Change the **Items per page** to a number large enough to encompass all of the logs.

10. Click **Export CSV** to export the records.
11. Send the downloaded logs to Stellar Cyber Customer Success.
12. Configure your device to stop sending logs to port 5201.
