Stellar Cyber 6.6.0s is now live! Discover all the updates in the release notes!

Configuring Recipients

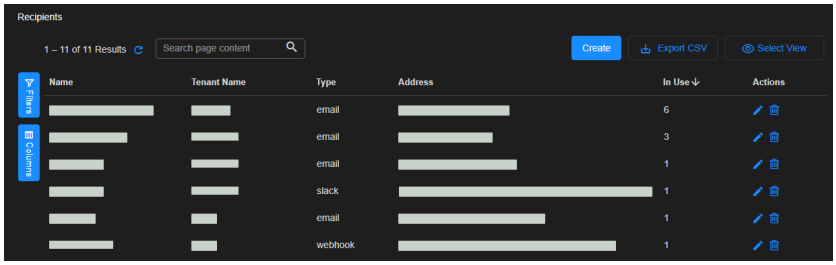

Use the **System | Recipients** page to manage recipients of alerts from Stellar Cyber. Instead of entering an email address in multiple locations, you can use this page to manage recipients centrally, making maintenance much easier. If a recipient's email address changes, you only need to change it in one place.

Recipients can receive messages using any of the following methods:

- Email
- Slack
- Webhook

Recipients Table

When you select **System | Recipients**, Stellar Cyber displays a table listing all currently configured Recipients, as in the example below.

For the definitions of the columns, see the following section on adding and editing records.

Actions that can be taken include:

- Select **Create** to add a new recipient to the table. See the section below.
- Select  to edit the corresponding recipient. See the section below.

   Note that you cannot edit an existing recipient's **Message Type**. Create a new recipient of the desired type instead.

- Select  to delete the recipient.

Note: You cannot delete a recipient that is in use (for example, by an ATH Playbook or Scheduled Report).

See the Tables page for more information on working with tables.

Adding or Editing a Recipient

The dialog box used to add or edit a recipient includes the following fields:

- **Name** – Each recipient is assigned a unique name by the user. This is the value that is referred to in configuration forms elsewhere in the system. This field does not support multibyte characters.
- **Tenant Name** – The name of the tenant to which the recipient belongs or **All Tenants**.
- **Message Type** – This is a selection box with the type of media that will be used when sending messages to the recipient (**Email**, **Slack**, or **Webhook**). The rest of the dialog box provides different options depending on the selection here, as described below.

Note that you cannot edit an existing recipient's **Message Type**. Create a new recipient of the desired type instead.

Options for Email Message Types

- **Email Address** – The email address to which Stellar Cyber sends messages. This appears when **Message Type** is set to **email**.

Options for Slack Message Types

- **Slack Web URL** – The URL to use when sending Slack messages. This field appears when **Message Type** is set to **slack**.

Options for Webhook Message Types

- **Protocol** – Select either **HTTP** or **HTTPS**
- **Basic Authentication** – Select this check box to use Basic Authentication.
    - If you enable **Basic Authentication**, additional fields for a Username and Password appear. The password is masked as you enter it and is not shown in the summary table of configured recipients.

      Keep in mind the following rules for webhook usernames and passwords:
        - For versions prior to 5.03:
            - Enter the **username** without the **@** or period **(.)** characters.
            - Enter the **password** without any non-alphanumeric characters except for the underscore (_).
        - From v5.0.3 and later, you can use any non-alphanumeric characters in both the username and password fields, including the **@** and period **(.)** characters.

    - If you do not enable **Basic Authentication**, the Webhook uses bearer token authentication instead.
- **Host** – The host where the webhook message is sent. This can be either a hostname or an IP address.
- **Port** – The port where the webhook message is sent. If you do not specify a port, the default ports for the selected Protocol are used (HTTP/80 or HTTPS/443).
- **Path** – The path where the webhook message is sent on the specified host. If you do not specify a path, the message is sent to the base URL.

Stellar Cyber uses these fields to construct the URL where the webhook message is sent using the following formula:

`http://<host>:<port>/path`

For example, consider the settings in the image below:

These settings result in the following Webhook URL:

`https://testrecipient.com/webhook`

Select **Submit** to save your changes. Alternatively, you can select the **X** button in the upper right corner of the dialog box to cancel the entry.
