Stellar Cyber 6.6.0s is now live! Discover all the updates in the release notes!

Managing Scheduled Reports

Stellar Cyber can automatically run scheduled reports and email them to configured recipients. Any number of scheduled reports can be active in the system and can be viewed in the Manage table at **Reporting | Reports**. The table appears in the lower half of the page below the **Reports (Beta)** and **Exported Dashboards** tabs.

The Manage table behaves like all other Stellar Cyber tables. You can change the displayed columns, sort by columns, and export the displayed list, for example. This table also includes an **Actions** column, which—depending on the report or exported dashboard configuration and your user account scope and privileges—is where you can view, edit, delete, and send reports and exported dashboards.

The Manage tables include the following columns:

The term "Report" in the table column names applies to both PDF reports and exported dashboards functioning as reports.

- **Report Name** – The name of a report
- **Report Type** – This field is automatically populated for reports from one of the predefined report tabs. For **Custom** reports, this field is the same value as the **Report Name** and cannot be modified.
- **Created At** – The timestamp when a report was created
- **Created By** – The name of the Stellar Cyber user who created a report
- **Report Time Interval** – The interval of time for which a report is scheduled
- **Frequency** – How often a report is run

- **PDF Type** – The type of PDF
- **Day of Month** – For a report that's scheduled to run on a monthly basis, this indicates when it's run: **First Day**, **Middle of Month**, or Last **Day**.
- **Day of Week** – For a report that's scheduled to run on a weekly basis, this indicates which day of the week it's run
- **Failed Reason** – If Stellar Cyber was unable to run a report, a reason appears is here; for example, "FailOutstanding"
- **Last Modified At** – The timestamp when a report was last modified
- **Last Sent Time** – The most recent time that a report was run and sent to recipients
- **Report Timezone** – The time zone defining the local time where the activity occurred that you want to include in the report.
- **Schedule Time** – The time of day to run and send a report
- **Last Generation Step** – If Stellar Cyber is unable to generate and send a report, this states the last step in the process when the failure occurred.

  Possible "Last Generation Steps"

  Set up Error Listeners: Configure listeners to monitor any response errors that occur when the UI page sends HTTP requests to the UI server.

  Go To Login Page: Simulate a user navigating to the login page and attempting to log in using a specified account and password.

  Set Report on Page: Define the configuration parameters for a specific report prior to its generation.

  Redirect to Report Page: Generate the report and then redirect the user to the report page.

  Report Loading: Wait for the report generation process to complete.

  Report Load Complete: Confirm that the report has been successfully generated.

  Get Report Source: Retrieve the PDF content of the report from the page.

  Get CSV Text: Obtain the CSV file of the report from the page.

  Send Report to Server: Transmit the report to the email server.
- **Per Tenant Flag** – Whether discrete reports are generated for individual tenants

  Possible Values

  N/A: When a scheduled report is based on exported dashboards, there is no option to generate reports for each tenant.

  True or **False**: When a scheduled PDF report is for **All Tenants**, this indicates if separate reports are generated for each tenant (**True**) or not (**False**). When a report is for multiple tenants or a tenant group, per-tenant reports are always enabled.

  (**-**): When a report is for a single tenant, a dash indicates that the per-tenant report setting is irrelevant (and is ignored).

- **Schedule Timezone** – The time zone defining when to run and send a report. Note the difference between **Report Timezone**, which determines the data that goes in a report, and **Schedule Timezone**, which determines when the report is generated. For example, if you're at an office in California and want to generate reports for a network in Japan, you'd set the **Report Timezone** for Japan to include activity when it occurred in its local time zone, and you'd set **Schedule Timezone** for California to generate the report when you want it in your local time zone.
- **Schedule Type** – This indicates if a report is **Scheduled** or **Run Now**
- **Send CSV** – Indicates whether a CSV file is configured to be sent
- **Sent Status**—The result of the report run
- **Shared With** – Icons with initials of report recipients. Hover your cursor over them to see the full recipient name.
- **Status Message** – The delivery status of one or more reports, depending on the number of tenants in the report configuration and type of delivery (one consolidated report or multiple discrete reports for all tenants). Select the
- **Tenant/Tenant Group** – The tenant for which the report was run
- **Theme** – Identifies the cover theme applied to a report, if one is configured.

You can initiate the following tasks in the Actions column:

- Select the **View scheduled report** icon to generate a report and display it in your browser. The report contains data for the current time range defined in its schedule, such as the most recent seven-day period from the moment you select **View scheduled report**.
- Select the **Edit scheduled report** icon  to generate a scheduled report and edit settings in the **Report Details** dialog box that appears.
- Select **Delete report**  to delete the scheduled report.

  This only deletes the scheduled report, not the original PDF report or exported dashboard on which it was based.

- Select **Show report history** to view previous executions of a report and optionally resend a specific instance. For detailed instructions, see *View Report History* in **Create & Schedule Reports**
- Select **Send Report Now** to generate and email a scheduled report to the specified recipients. The report uses the relative time range defined in its schedule, calculated from the moment you select this action. For example, a report configured for the last seven days includes data from the most recent seven-day period ending at the time you run it.

  Both **View scheduled report** and **Send Report Now** generate a report using the current time range, while **Send Report Now** in the **Report History** panel reproduces the data from the time the original report was created.

You can also Export a list of scheduled reports in CSV format.

Troubleshooting Emailed Reports

The following tips can help you troubleshoot issues with emailed reports:

- Some email systems may truncate or refuse to send messages with excessive records included. If you find that emailed reports are not sending, try reducing the table size configured in a scheduled report below 1000 records.
