Stellar Cyber 6.6.0s is now live! Discover all the updates in the release notes!

Provisioning Disk Space for Virtual Modular Sensors

In order to guarantee the performance of your virtual modular sensors, you must provision sufficient disk space using the instructions in this topic.

The disk space required by a sensor varies depending on the features enabled, expected data/log volume, number of configured IDS rules, and buffer settings in the Modular Sensor Profile. The most important factors affecting sensor disk size requirements are as follows:

- **Enabled Features/Modules** – Each module enabled in the Modular Sensor Profile (for example, log forwarder, IDS, aggregator, sandbox, network traffic) increases disk requirements. More features running simultaneously require more disk space.
- **Buffer Settings** – The buffer sizes configured in the Modular Sensor Profile for logs, network traffic, and IDS directly affects disk usage. Larger buffer settings mean more disk space is needed to store temporary data.
- **Log and Data Volume** – Higher log volume and network traffic increase the amount of data written to disk, requiring more space for storage and buffering.
- **Sandbox Activity** – Intensive sandboxing or many short sessions can cause disk usage spikes, requiring extra disk capacity.

To determine an appropriate disk size for your sensor:

1. Start with the default disk size for a Modular Sensor of **76 GB**.

   You can't change the disk size for a Modular Sensor below the default of 76 GB.

2. Add the sizes specified in your selected Modular Sensor Profile for the **Log Forwarder Buffer**, **Network Traffic Buffer**, and **IDS Buffer** options.
3. Provision additional disk headroom based on your expected log/data volume, bursty traffic environments, and expected sandbox activity. Fine-tune based on your retention goals, local peaks, and IDS rule set size.

For a Modular Sensor with all features enabled and the **Log Forwarder**, **Network Traffic**, and **IDS** buffers all configured to their maximum values of **32 GB**, Stellar Cyber recommends the

following:

```
   76 GB Default Disk Size
   32 GB Log Forwarder Buffer
   32 GB Network Traffic Buffer
   32 GB IDS Buffer
+ 100 GB Additional Disk Size
---------------------------------
  272 GB Total Disk Size Required
```
