Stellar Cyber 6.6.0s is now live! Discover all the updates in the release notes!

Quick Start: Administrators

Learn more at Stellar Cyber Academy.

The following link takes you to a course on the Stellar Cyber Academy technical training portal where you can learn more about this topic by watching the suggested lessons.

M02 Administration Essentials for Tenants, Users, and System (03h:46m)

Introduction and Agenda (08m:00s)

Explore essential administrative tasks in the Stellar Cyber Platform, including tenant configuration, role-based access control, two-factor authentication, and certificate management for secure access. Learn how to configure custom-branded logos, mail server settings for alert notifications, and set up the System Action Center for real-time monitoring and notifications.

Multi-Tenant Concepts and Configuration (38m:00s)

Explore multi-tenant architecture within the Stellar Cyber Platform, including how data segregation, machine learning customization, and operational views support managed security service providers (MSSPs) managing multiple organizations or business units. Learn how tenant-specific Interflow data is stored and processed within the data lake, and how threat intelligence and machine learning models can be scoped and tuned at the tenant level. Follow a step-by-step demonstration on creating and configuring tenants, assigning access levels, and setting up a tenant admin user with two-factor authentication. Discover how tenant boundaries enforce data isolation while allowing centralized visibility across your environment within the Stellar Cyber Platform.

User Management with Role-Based Action Control (20m:00s)

Discover how to manage user privileges using role-based access control (RBAC) within the Stellar Cyber Platform. Follow a demonstration on configuring privilege profiles — including Super Admin, Platform Admin, and Security Admin — and learn how to assign roles and scopes to control access levels across tenants. Explore how RBAC configurations help meet organizational security needs while ensuring compliance with access control policies.

User Management with Multi-Tenant Architecture (36m:00s)

Learn how to assign users specific tenants or tenant groups, configure API access, and set up two-factor authentication for secure access. Gain insights into viewing user activity logs and monitoring active session connections to ensure compliance and security within the Stellar Cyber Platform.

The first time you access a link on the portal during a session, you must log in to access content.

Each user's function working with Stellar Cyber can vary. In many deployments, the administrator will have a different perspective than an analyst. During initial setup and on an ongoing basis, you will use the Stellar Cyber user interface to integrate data sources, configure dashboards and automations, and manage the server and users. Those configuration settings are spread throughout the Stellar Cyber interface.

After reviewing the main Getting Started topic, you may find this section helpful to familiarize yourself with the location of configuration pages you may need.

- This list highlights **settings for the server itself**.
    - The System | Administration section addresses the server-level settings such as users, tenants, licensing, and so on.
    - As part of your installation, you use the **System | ORGANIZATION MANAGEMENT | Settings** page to configure the SSO / authentication requirements for how your users will access the server.
    - In the **System | ORGANIZATION MANAGEMENT** section, create and manage users from Users and Role-based Access Control. Even if you have configured SSO, you will still need to set certain user access parameters.
    - For partner and MSSP deployments, configure Tenants and Tenant Groups, depending on your organizational needs.
- The following list highlights configurations related to **data integration and response**, which you begin to use after the fundamental aspects of the server are configured.
    - Take a look at the Ports list so you are familiar with the ingoing and outgoing ports that are required for your deployment plan.
    - External sources for ingestion and response (Connectors and Sensors) are added and configured from the **System | DATA SOURCE MANAGEMENT** and **System | INTEGRATIONS** sections.
    - Each sensor must be associated with a sensor profile, which in turn must be associated with a specific receiver. Receivers are also configured from the **Collection** section.
    - To manage the volume of data ingested from sensors, you can also set up traffic and log filters; these are accessed from the **Collection** section.
    - Dashboards are configured from the Dashboards menu. You can use these dashboards to configure and schedule reports Reporting functions are accessible from the Reporting menu.

- Either you or an analyst can configure custom, automated threat hunting actions from the Automation menu. These automated playbooks based on specific data and conditions are configured to perform a response action. The **System** section includes options to configure recipients on the server, scripts, and other settings to support playbooks and other general functions.
