Stellar Cyber 6.6.0s is now live! Discover all the updates in the release notes!

Routers

Stellar Cyber automatically identifies assets that are routers by recognizing MAC addresses simultaneously associated with more than 6 IP addresses. It marks those assets as routers and displays them in the **Router** tab (**Assets | Asset Analytics | Router**). Routers do not have IP addresses associated with them.

Setting an Asset as a Router

You can confgure an asset as a router in the **MAC Identified Assets** and **IP Identified Assets** tabs.

To classify an asset as a router:

1. Select **Assets | Asset Analytics**.

   The assets dashboard appears.

2. Select either **MAC Identified Assets** or **IP Identified Assets**.

   The table of assets appears.

3. Choose the assets using the check box on the left of each row.
4. Choose **Type** in the bulk action drop-down list.
5. Choose **router** in the next drop-down list.
6. Select **Apply**.

   The assets are immediately marked as routers and removed from the assets table. They appear in the **Router** tab.

Use the check box in the header of the table to check or un-check all rows.

Setting a Router as a Client

If an asset is set as a router, you can reset it to an asset. To mark a router as a client asset:

1. Select **Investigate** | **Asset Analytics**.

   The assets dashboard appears.

2. Select **Router**.

   The table of routers appears.

3. Choose routers using the check box on the left of each row.

4. Choose **Type** in the bulk action drop-down list.

5. Choose **client** in the next drop-down list.

6. Select **Apply**.

   The assets are immediately marked as clients and removed from the routers table. They appear in either the **MAC Identified Assets** or **IP Identified Assets** tabs.

Use the check box in the header of the table to select or clear all rows.
