Stellar Cyber 6.6.0s is now live! Discover all the updates in the release notes!

Rules Contributing to Suspicious OCI Configuration Change to Network Security Group Alert 6.0.0

This topic covers a feature that is not available for all customers yet. See Early Access Program Features and Topics Under Development.

The following rules are used to identify suspicious configuration changes to Network Security Groups in OCI. Any one or more of these will trigger the Suspicious OCI Configuration Change to Network Security Group Alert. Details for each rule can be viewed by clicking the **More Details** link in the description.

Title	Description

OCI Network Security Group Configuration Change Detection	Identifies a change to an OCI network security group configuration. A network security group (NSG) provides virtual firewall rules for a specific set of VNICs in a VCN. A security rule is one of the items in a NetworkSecurityGroup; it can be for either inbound or outbound IP packets. Modifying configurations may allow unauthorized access. Threat actors may abuse this to establish persistence, exfiltrate data, or pivot in an OCI environment.

Additional Information

Maturity	Creation Date	Risk Level	False Positives
experimental	2025/02/24	low	• Network security group modifications may be part of regular infrastructure maintenance. Verify if this action aligns with known, scheduled administrative activities. • If you are using automated tools like `Terraform` or `CloudFormation`, confirm if the change matches expected configuration drift corrections or deployments.
