Stellar Cyber 6.6.0s is now live! Discover all the updates in the release notes!

Rules Contributing to Suspicious OCI Instance Image Export Alert 6.0.0

This topic covers a feature that is not available for all customers yet. See Early Access Program Features and Topics Under Development.

The following rules are used to identify suspicious instance image export activity in OCI. Any one or more of these will trigger the Suspicious OCI Instance Image Export Alert. Details for each rule can be viewed by clicking the **More Details** link in the description.

Title	Description

OCI Instance Image Export Failure	Identifies a failed attempt to export an OCI instance. A virtual machine (VM) export may indicate an attempt to extract or exfiltrate information.

- oracle.data.eventName
- stellar.rule_id

Additional Information

Maturity	Creation Date	Risk Level
experimental	2025/02/26	low

False Positives

- VM exports may be done by a system or network administrator. Verify whether the user identity, user agent, and/or hostname should be making changes in your environment. VM exports from unfamiliar users or hosts should be investigated. If known behavior is causing false positives, it can be exempted from the rule.
- Routine backup operations may trigger the rule if they involve failed export attempts. To manage this, identify and whitelist specific IAM roles or users that regularly perform legitimate backup tasks.
- Development and testing environments often involve frequent export attempts for non-production instances. Exclude these environments by tagging instances appropriately and adjusting the detection rule to ignore these tags.
- Misconfigured export tasks due to incorrect permissions or settings can lead to false positives. Regularly review and update IAM policies and export configurations to ensure they align with intended operations.
- Automated scripts or tools that manage instances might occasionally fail due to transient issues, causing false alerts. Monitor and log these scripts' activities to distinguish between expected failures and potential threats.
