Stellar Cyber 6.6.0s is now live! Discover all the updates in the release notes!

Rules Contributing to Suspicious OCI Security Service Impairment Alert 6.0.0

This topic covers a feature that is not available for all customers yet. See Early Access Program Features and Topics Under Development.

The following rules are used to identify suspicious impairment activity to security services in OCI. Any one or more of these will trigger the Suspicious OCI Security Service Impairment Alert. Details for each rule can be viewed by clicking the **More Details** link in the description.

Title	Description

OCI Impair Security Services	Identifies attempts to delete critical OCI security service configurations, such as CloudGuard detector recipes and recipes from Vulnerability Scanning Service (VSS). This activity is significant because it indicates potential efforts to disable security monitoring and evade detection. If confirmed malicious, this could allow attackers to operate undetected, escalate privileges, or exfiltrate data without triggering security alerts, severely compromising the security posture of the OCI environment.
	
	More details
	
	Rule ID
	`oci_audit_12`
	
	Query
	`{'selection': {'eventName': ['deletecontainerscanrecipe', 'deletehostscanrecipe', 'deletecontainerscantarget', 'deletehostscantarget', 'deletedetectorrecipe', 'deletedetectorrecipedetectorrule', 'deletedetectorrecipedetectorruledatasource']}, 'condition': 'selection'}`

Additional Information

Maturity	Creation Date	Risk Level	False Positives
experimental	2025/02/24	high	• Routine maintenance or administrative actions may lead to the deletion of a detector or scan recipe. Verify if the deletion aligns with scheduled maintenance or administrative tasks. • Automated scripts or tools used for environment cleanup might inadvertently delete detector or scan recipes. Review and adjust automation scripts to prevent unintended deletions. • Organizational policy changes or restructuring could result in recipe deletions. Ensure that policy changes are communicated and understood by all relevant teams to avoid unnecessary deletions. • Exclude known and authorized users or roles from triggering alerts by creating exceptions for specific IAM roles or user accounts that are responsible for legitimate recipe deletions. • Implement logging and alerting for recipe deletions to quickly identify and verify the legitimacy of the action, allowing for rapid response to potential false positives.
