Stellar Cyber 6.6.0s is now live! Discover all the updates in the release notes!

Stellar Cyber API Reference 6.6.0 OAS 3.1

This page lets you explore the different public APIs available for the Stellar Cyber Open XDR platform. Stellar Cyber performs end-to-end threat detection and response, combining multiple capabilities – NG-SIEM, NDR, TIP, IDS, SOAR, and UEBA – into a single user experience. Note: Entries in the reference with a line through them still exist in the product but are deprecated (for example, the /cases API has replaced the /incidents API, which is now deprecated).

Authorization Instructions:

1. If you don't already have an API key or token, get one from the user interface:
    - **Scoped Key** – Use the **Create API Key** button in the **API Keys** tab of the Edit User and User Profile dialog boxes.
    - **All-Access Token** – **Super Admins** with **root Scope** can use the **Generate Token** button in the **API Access** section of the Edit User dialog box.
2. Click the **Authorize** button on this page.
3. Log in differently depending on the credentials you're using:
    - **Scoped Key** – Use the **api key (http, Bearer)** option. Enter your API key in the **Value** field and click **Authorize**.
    - **All-Access Token** – Use the **basic (http, Basic)** option. Enter the email address tied to your account in the **Username** field and the token in the **Password** field, then click **Authorize**.

        ⚠️ **Note:** If you normally log in with a username, you **must** enter the email address instead. Usernames will not work in the **basic** options.
4. Open the **/access_token** endpoint, click **Try it out**, and then **Execute**.
5. Copy only the green JWT token from the response.

    💡 **Tip:** Don't use the **Copy** button — it copies the full response body. Select just the green JWT token (inside quotation marks).

6. Click the **Authorize** button again.

7. Paste the copied JWT  n into the **jwt (http, Bearer)** field and click **Authorize**.

🔁 **Token Expiration:** JWT tokens expire 10 minutes after creation. If you experience authorization failures, repeat these steps to generate a new one.

Access Token

POST `/access_token`

AI Agent - Alert Management

GET `/ai/alerts/detail`

AI Agent - Case Management

GET `/ai/cases/detail`

Alert Types

GET `/alert_types`

Alert Watcher

GET	/alert_watchers
