Stellar Cyber 6.6.0s is now live! Discover all the updates in the release notes!

Understanding Tenants

Learn more at Stellar Cyber Academy.

The following link takes you to a course on the Stellar Cyber Academy technical training portal where you can learn more about this topic by watching the suggested lessons.

M02 Administration Essentials for Tenants, Users, and System (03h:46m)

Multi-Tenant Concepts and Configuration (38m:00s)

Explore multi-tenant architecture within the Stellar Cyber Platform, including how data segregation, machine learning customization, and operational views support managed security service providers (MSSPs) managing multiple organizations or business units. Learn how tenant-specific Interflow data is stored and processed within the data lake, and how threat intelligence and machine learning models can be scoped and tuned at the tenant level. Follow a step-by-step demonstration on creating and configuring tenants, assigning access levels, and setting up a tenant admin user with two-factor authentication. Discover how tenant boundaries enforce data isolation while allowing centralized visibility across your environment within the Stellar Cyber Platform.

Tenant Assignment for Stellar Cyber Components (42m:00s)

Discover how to assign tools, queries, dashboards, connectors, and sensors to tenants within the Stellar Cyber Platform. Learn how Modular Sensors, Windows Server sensors, Linux Server sensors, and connectors are configured to maintain data segregation and support tenant-specific machine learning across both SaaS and on-premises deployments. Explore the practical steps required to ensure that data flowing into the data lake remains properly isolated per tenant, preserving the integrity of threat intelligence and Interflow records associated with each organization. Follow along with a hands-on demonstration that walks through tenant-based assignments for queries and dashboards, and watch how these configurations come together to support accurate, tenant-aware analysis across the Stellar Cyber Platform.

The first time you access a link on the portal during a session, you must log in to access content.

Stellar Cyber is a truly multi-tenant platform. This allows a single Stellar Cyber installation to serve any number of unique, separate companies, organizations, or departments while keeping security information fully separated. Not only is the data separate, but machine learning is also unique for each tenant. This feature has two main use cases:

- To implement the MSSP (Managed Security Service Provider) business model where the serving organization operates and manages Stellar Cyber and provides security monitoring to any number of client companies. The individual client companies are tenants, and Stellar Cyber sees each company as a unique and separate entity.
- For larger organizations multi-tenancy allows the delegation of security functions to subordinate departments. For example, a company with offices in different regions can assign each branch its own Stellar Cyber tenant. The home office operates and manages the data processor, leaving the branches to focus locally.

This overview page describes the basic concepts that apply across the Stellar Cyber system with regard to tenants.

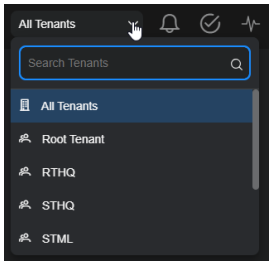

Tenant Definition

A tenant is defined in the system using the name assigned by the system administrator. (See Tenant Users.) The system also assigns a unique ID to each tenant. This ID appear in Interflow records and can also be seen in the System | ORGANIZATION MANAGEMENT | Tenants page when the **ID** option is enabled in the column picker.

For users that have multi-tenant access, the user interface includes a dropdown in the upper right corner of the screen that lets you select the tenant whose data you want to see. This control acts as an overall filter for all data record information. If a specific tenant is selected, then only event and Interflow records that belong to that tenant are displayed and can be acted upon.

The **All Tenants** selection removes the filter and all records in the Data Lake become accessible.

If you have many tenants defined, the **Tenants** dropdown includes a Search capability that helps you quickly find exactly the tenant you're seeking, as illustrated below.

The **Tenants** drop-down menu does not appear for tenant users. Instead the filter is preset to the Stellar Cyber tenant to which the user has been assigned and cannot be changed.

A security analyst will typically select a specific tenant when responding to a report regarding trouble in a specific region or for a specific client.

All Tenants

This might be used when a record or entity is intended to be regarded as enterprise-wide and not for a specific tenant.

Tenant Users

Users with tenant scope are used to provide visibility-level access to individuals that belong to the sub-divisions that the tenant represents.

Tenant users:

- Do not have access to the case management function.
- Cannot create automated threat playbooks.
- Cannot take firewall response actions.
- Do not have access to configuration and administrative functions.

Attributes of Tenants

The tenant identity appears in almost all data records collected and managed by Stellar Cyber.

- Interflow records and events are assigned to a tenant.
- Sensors are assigned to a tenant. When they generate Interflow records those data are keyed to the tenant to which they belong.
- Connectors are assigned to a tenant.
- Saved queries are tenant-specific. The saved queries that one tenant user creates cannot be seen by users of other tenants.
- Custom dashboards are tenant-specific.

Tenant Groups

You can group tenants, which allows you to easily manage multiple tenants and users at those tenants.

You can add tenants to groups on the **System | ORGANIZATION MANAGEMENT | Tenant Groups** page. See Tenant Groups for more information.
