Stellar Cyber 6.6.0s is now live! Discover all the updates in the release notes!

Using the Detection Tab in the Case Details View 6.1.0

The **Detection** tab is the default display for the Case Detail view – it's what you see when you first open the Detail view of a case. From here, you can get a high-level summary of the case, including a breakdown of what Stellar Cyber has seen and why it is scoring the case the way it is. You can also see a summary of the XDR Kill Chain stages involved, and a table of Associated Alerts.

The figure below illustrates key features of the **Detection** tab:

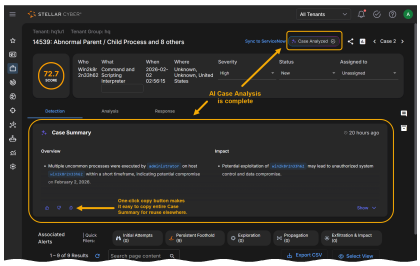

- **Case Score Breakdown** lists the XDR Kill Chain stages with associated alerts, as well as the observables involved in the case (internal or external hosts, as well as URLs, files, users, services, processes, and sensor status alerts).

  If AI Case Analysis is enabled in your version of the Stellar Cyber Platform, the **Case Score Breakdown** is replaced by a Case Summary with a high-level narrative of the case.

Automated Case Summary in the Detection Tab 6.4.0

When AI Case Analysis is enabled in Global Settings, you can run AI Case Analysis to accelerate investigations with AI-generated narratives, insights, and suggested incident responses in the Detection, Analysis, and Response tabs in the Case Detail view.

After running AI Case Analysis on a case, the **Detection** tab in the Case Detail view replaces the **Case Score Breakdown** with a new, AI-generated **Case Summary**, as shown in the figure below:

The **Case Summary** provides a high-level narrative of the case to help you quickly understand the nature of the incident without reviewing every individual alert. This can reduce triage time by giving you a fast, reliable entry point into an investigation.

The Case Summary includes the following information:

- **Overview** – A concise explanation of the triggering activity and its immediate impact.
- **Key Insights** – Highlights of the most important findings, such as compromised accounts, suspicious reconnaissance, or exploit attempts.
- **Impact** – A description of potential business and operational consequences, such as data loss or compromised accounts.
- **Recommended Next Steps** – A short list of high-level actions, such as forensic review or account audits.

You can use the one-click copy button at the base of the Case Summary to copy all four of these sections for easy pasting elsewhere.

Next Steps with AI Case Analysis

- For deeper case analysis, see the **Hypothesis**, **Timeline**, and **Observables** panels in the **Analysis** tab.
- For next steps and actionable response guidance for the case, see the Response tab.

Using the Associated Alerts Table

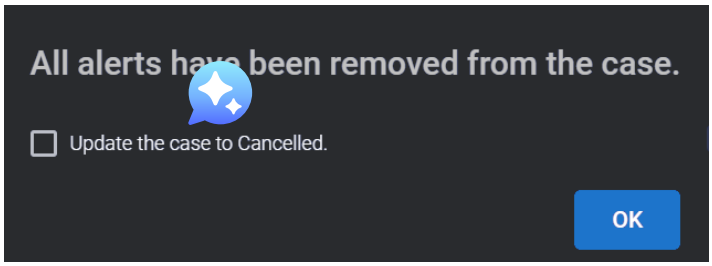

The **Detection** tab also provides the **Associated Alerts** table, a sortable table of all alerts associated with the case.

In addition to standard Stellar Cyber table functionality for searching, sorting, exporting, and column management, the **Associated Alerts** table lets you perform the following useful tasks for a case:

- Remove any alert in the table from an case by clicking its **Delete** button . Alternatively, you can bulk delete multiple alerts by selecting their entries in the table and then clicking the **Remove Alerts** button. Regardless of the technique you choose, Stellar Cyber asks you to confirm your choice before deleting the alert(s).

  Note the following:

  - Deleting an alert from a case might change its score as Stellar Cyber reevaluates the case in light of the new suite of associated alerts.
  - After you remove all alerts from a case, Stellar Cyber asks if you want to set the case status to **Cancelled**, as shown below:

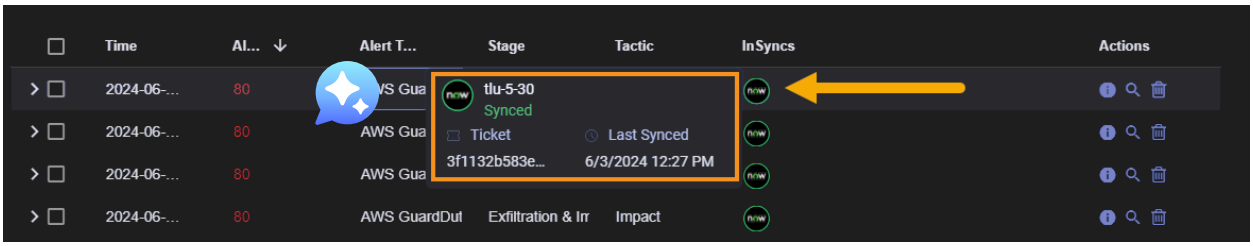

You can also remove alerts from a case without deleting them by selecting their check boxes in the table and then using the drop-down at the top of the table to set their **Event Status** to either **Ignored** or **Closed**. This way, you can remove an alert from a case without losing visibility of its previous existence.

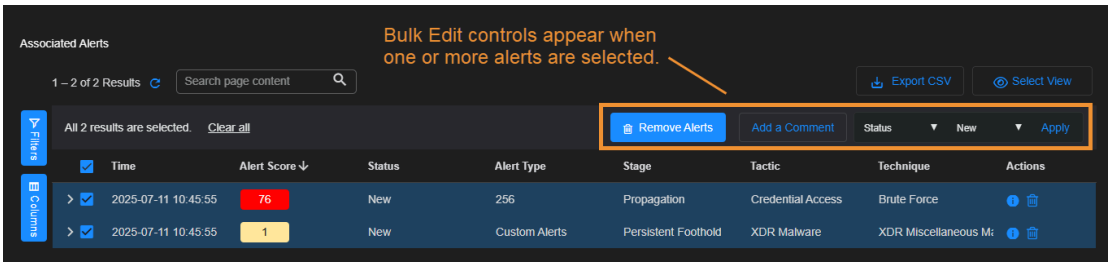

- Apply **Quick Filters** to the Associated Alerts table to focus the list on just those alerts matching a selected Kill Chain stage. Remove a Quick Filter either by applying a different one or using the **Clear All** button that appears when a Quick Filter is applied, as illustrated below. 6.6.0

- Select the **More Info** button for any alert in the **Alerts** table to see its associated Event Details, including the supporting Interflow data. From here, you can find a **Cases** list that shows other cases associated with an alert in descending order by score up to a maximum of five. You can then drill into another related case detail display or use the **View All** link at the top of the list to see a filtered tab showing only those cases associated with the selected alert.
- Cascade any alert open using the **>** button at the far left of the **Alerts** table to see its associated Interflow data.
- Add comments to one or more alerts by selecting their entries in the table and then using the **Add a Comment** button.
- Add the **InSyncs** column to the display to get more information about cases that are synchronized with an associated ServiceNow installation using an InSync. You can hover your mouse over the **NOW** icon in the **InSyncs** column and see the following information on the synchronization for the case:
    - The name of the InSync performing the synchronization between Stellar Cyber and the third-party application (ServiceNow in this release).
    - The status of the InSync (**Synced**, **Paused**, or **Error**).
    - The ticket number for the synchronized case in ServiceNow.
    - The last time the case was synchronized, expressed in the time zone of your browser.

- Use the **Bulk Edit** options to change information for multiple alerts simultaneously:

  1. Select the check boxes for one or more alerts to enable the Bulk Edit controls.

     You can change **Status**, **Event Tags**, or **Assignee**.

  2. Select the field you want to edit.
  3. Use the adjacent Bulk Edit drop-down to set the new value.

     The available values change depending on which field you are editing.

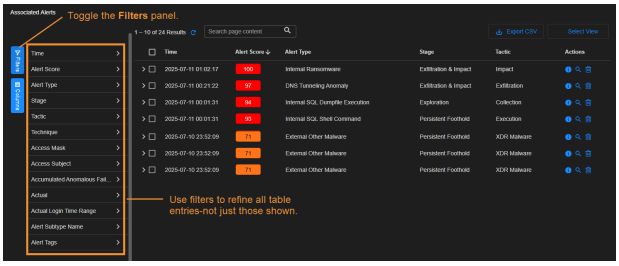

- Export the contents of the Associated Alerts table to a CSV file using the **Export CSV** button.

  You can also export the case as a whole using the Export button in the Case Identification panel at the top of the display  . This technique exports both a PDF and a CSV file of the case.

Applying Display Filters to the Associated Alerts Table

The Associated Alerts table supports standard display filtering capabilities:

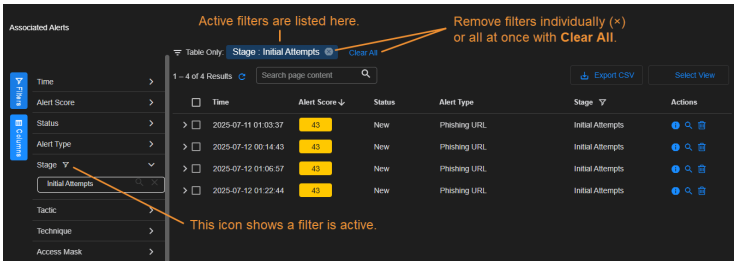

1. Select the vertical **Filters** button at the left of the table to see the available display filters. For example:

2. You can filter by any combination of the listed criteria. If a particular criterion you expect to see is not listed, use the **Add new filter** feature to see all available criteria.

   Display filters apply to all table entries, not just those that are currently visible (for example, if a table contains multiple pages of entries, the filter applies to all pages, not just the currently visible page).

Display filters that are currently applied are displayed with a distinctive filter icon in their entry. In addition, the currently displayed filters are summarized at the top of the table, as shown below.

You can remove filter criteria individually by clicking the close icon ("x) in their entries at the top of the table, or remove all filters with the **Clear All** button.
