Stellar Cyber 6.6.0s is now live! Discover all the updates in the release notes!

Using the Notification Center 5.2.0

The **Notification Center** lists the past week of system notifications available to your scope and tenancy according to the current toolbar filters. Notifications are generated based on the settings in **System | System Action Center** and can help you keep tabs on important system events related to:

- **Case Management** – Get notifications when cases are assigned, closed, escalated, created, updated, or have a score that meets or exceeds a specified threshold.
- **Connector Monitoring** – Get notifications when specified connectors haven't sent data over a given time interval so you can address issues in real time.
- **Device Sensor Monitoring** – Get notifications for different device sensor health issues (for example, no data or heartbeats).
- **License Enforcement** – Find out proactively when your license limits are approaching an undesirable state or have been exceeded.
- **License Usage** – Get notifications when asset usage or ingestion usage exceeds specified thresholds or when asset counts decrease by a configurable percentage.
- **Log Source Monitoring** – Get notifications when log sources stop sending data.
- **Platform Health** – Get notifications when Stellar Cyber Platform health issues affect data ingestion, storage, cluster performance, or UI availability.

  Platform Health alerts are only available as part of an Early Access Program and may not appear in your version of the Stellar Cyber Platform. Contact your account manager to inquire about taking part in an Early Access Program.

- **Playbook Monitoring** – Get notifications when an ATH Playbook experiences a change in status (for example, failure or recovery).
- **Scheduled Report Monitoring** – Get notifications when a scheduled report fails.
- **Sensor Token** – Get notified when a token used to authorize sensors is about to expire.
- **Server Sensor Monitoring** – Get notifications when server sensors experience a change in status, stop sending data, or stop sending heartbeats.

- **TIP Feed Monitoring** – Get notifications when a TIP feed stops sending data or does not respond to polling.
- **User Modifications** – Get notifications for a wide variety of events related to user accounts and RBAC policies.

Refer to **Best Practices for the System Action Center** for guidance on ways you can configure notifications effectively in your organization.

Required Privileges

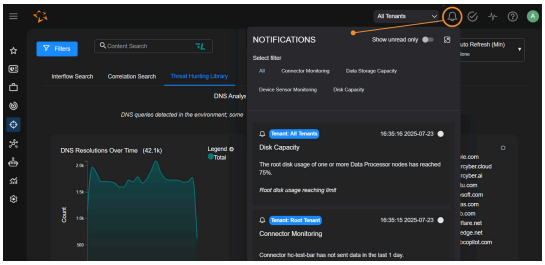

The Notification Center is only available to accounts with the **System | Notification** privilege assigned to their profile in the **System | ORGANIZATION MANAGEMENT | Role-Based Access Control** page. By default, this includes only the **Super Admin** or **Platform Admin** roles.

Displaying the Notification Center

Display the Notification Center as follows:

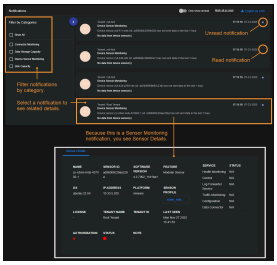

1. Select the **Notifications** icon in the main toolbar.

   The Notifications drop-down panel appears with **All** notifications shown by default.

2. To expand the Notifications panel to a full-page display, select the **Expand** icon in the upper right of the panel.

   The Notification Center appears.

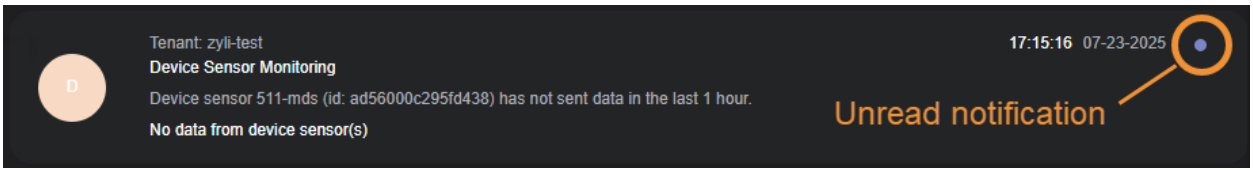

Working with the Notification Center

The Notification Center provides a handy interface to view system notifications generated based on the rules configured in the System Action Center. You can perform the following tasks from here:

- Select a notification to drill to further details elsewhere in the user interface. The link destination is different depending on the category of the notification you select:
  - Selecting a Connector Monitoring notification takes you to the Connector Details page for the associated connector.

- Selecting a License Enforcement notification takes you to System | ORGANIZATION MANAGEMENT | Licensing.
- Selecting a License Usage notification takes you to the Volume Usage tab on the **System | ORGANIZATION MANAGEMENT | Licensing** page.
- Selecting a Case Management notification takes you to the Case Detail page for the corresponding case.
- Selecting a Device Sensor or Server Sensor notification takes you to the Sensor Details page for the corresponding sensor.
- Selecting a Scheduled Reports notification takes you to the Scheduled Reports list for further investigation.
- Selecting a User Modifications notification takes you to the System | ORGANIZATION MANAGEMENT | Users page for further investigation.

- Use the **Filter by Categories** options to limit the display to just those alerts corresponding to the selected categories.
- Use the **Only show unread** toggle at the top of the Notification Center to limit the display to just those notifications you have not marked as read.
- Mark all notifications as read by using the **Mark all as read** link at the top of the Notification Center.
- Mark an individual notification as read by clicking the small dot at the right of its entry in the Notification Center, as illustrated below:

Using the Notifications Drop-down Panel

The Notification Center is an expanded version of the **Notifications** drop-down panel that appears when you first select the Notifications icon in the main toolbar.

In addition to letting you launch the full Notifications Center with the **Expand** link, the **Notifications**panel also provides the following features:

- Select a notification to drill into its details.
- Only show unread notifications.

These features all work in the same way as they do in the full Notification Center.
