Stellar Cyber 6.6.0s is now live! Discover all the updates in the release notes!

Vendor-Related Metadata

When Stellar Cyber ingests data, some of the information is stored in standardized fields (example: srcip) within the Interflow record. The table below shows a set of the standard fields that you may find helpful for identifying vendor-specific data in the searches or queries that you build.

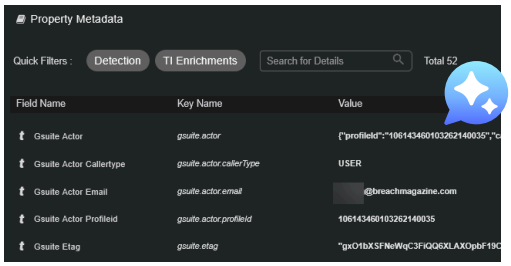

Metadata Field	Purpose	Examples
msg_origin.vendor	Vendor associated with the data	trendmicro
msg_origin.source	Vendor's product name associated with the data	trendmicro_cloudone
msg_origin.category	Overall data category	endpoint
msg_origin.processor.name	For connectors, this is the same as msg_origin.source	trendmicro_cloudone
msg_origin.processor.type	For connectors, this is always log_collector	log_collector
msg_class	Sub-category of data applicable to multiple content types from a vendor	trendmicro_cloudone_computers

View the metadata fields in the JSON tab.

Vendor-Specific Data

In addition to standard metadata fields in the Interflow record, Stellar Cyber dynamically creates fields to store vendor-specific data.

To learn which fields may be useful for your queries, expand the Interflow details in views such as the **Threat Hunting** Documents table. Locate the vendor name and note the fields. Repeat this with different Interflow rows, since Stellar Cyber does not typically create the fields if the incoming value is blank.
